

METHOD AND APPARATUS FOR HUMAN READABLE CHARACTER SCANNING
VERIFICATION AFTER PRINTING IN A GAMING PRINTER

5

CROSS-REFERENCE TO RELATED APPLICATION

This application claims the benefit of U.S. Provisional Application No. 60/254,321 filed on December, 11 2000, and U.S. Provisional Patent Application 60/326,080 filed September 10 28, 2001 which are hereby incorporated by reference as if set forth in full herein.

BACKGROUND OF THE INVENTION

This invention relates generally to gaming printers and more specifically to gaming printers with print verification features.

The gaming machine manufacturing industry provides a variety of gaming machines for the amusement of gaming machine players. An exemplary gaming machine is a slot machine. A slot machine is an electro-mechanical game wherein chance or the skill of a player determines the outcome of the game. Slot machines are usually found in casinos or other more informal gaming establishments.

Gaming machine manufacturers have introduced the use of a gaming printer allowing the printing of a voucher for a player's winnings when the player cashes out. The gaming printer may be resident in a slot machine or made available to a bank of slot machines via a gaming system. The voucher can either be redeemed with a cashier or redeemed by inserting the voucher into the same or another slot machine for playing credit, as if the voucher were money. The gaming printer's role, therefore, is to print out winnings thereby avoiding the need for the slot machine to dispense coins with each pay-out or jackpot won.

Gaming printers may be implemented using dot impact printers and thermal printers. Dot impact printers, also known as impact printers, are printers that make an image by striking an inked

5 ribbon overlaid on plain paper with a small pin that hammers the
ink onto the paper to make a small dot. Impact printers, by
10 their electro-mechanical nature, have a number of moving parts
and make a characteristic grinding sound, such as the noise made
by all older receipt printers. A thermal printer is a printer
where paper with a heat sensitive side is imaged using a print
head which applies heat in tiny dots (typically 1/200th of an
inch in size) in order to turn an area black. In this manner,
all images are created by a series of tiny black dots. A widely
known example of a thermal printer is the original fax machine.

15 The gaming printer may be controlled by a Gaming Machine
Interface Board (GMIB) such as a slot machine interface board
which is a controller board for a game resident within the
chassis of the game. The gaming printer may be controlled by
commands sent from a host controller board such as a GMIB, or
another host controller board upstream of the slot machine in
order to print vouchers.

20 Anytime there is an electro-mechanical device such as a gaming
printer, there is a chance of an equipment failure that leaves
the desired printing operation unaccomplished. For a thermal
printer used as a gaming printer, such a failure can occur for
a number of reasons: (i) the printer experiences a hardware
25 failure; (ii) a residue or heat transfer failing which prevents
a proper image from developing on the thermal paper ticket; or
(iii) a failure in the paper coating process at the factory so
that there is a drop out on the printed image.

30 Any of the above failures may prevent the ticket from
printing completely. Since a voucher, sometimes with a value of
\$1,000 or more is being dispensed (as opposed to real currency),
it is very important that the voucher delivery and redemption
process is highly reliable to allay a player's fear about the
handling of their "money". After a voucher is printed, the
35 voucher can be redeemed with a cashier or the voucher can be

redeemed through a slot machine's bill acceptor. A bill acceptor
is a device which automatically accepts paper currency by
5 scanning the paper currency and saving the paper currency within
the slot machine. A coin change machine usually has such a
device on it, and more recently, so do most slot machines. The
standard vouchers for this application usually bear a barcode
down the center of the voucher so that the voucher can be read
10 automatically by the bill acceptor.

In order for the bill acceptor to properly scan the ticket,
there must not be an error in the printing of the barcode, or the
process will fail. Any of the previously itemized printing
failures may cause the barcode to contain an error. Should such
15 an error occur, the ticket cannot be redeemed, requiring
significant casino resources to validate and hand pay the player
(who at this point is probably quite nervous and has lost some
of the thrill of the act of winning). A hardware failure of the
printer may be detected by the communications with the GMIB, and
20 thus an attendant may be alerted ahead of the pay out. However,
previously described failure modes (ii) and (iii) are modes which
may prevent the printing of a full image on the ticket and may
not be detected by the GMIB or the printer. An undetected error
may leave an operator of a slot machine to believe that a
25 complete and proper pay out has been made.

Previous attempts of vérification have focused on the
verification of the cashout value. For example, United States
Patent 6,012,832 issued to Saunders, et al. entitled "CASHLESS
PERIPHERAL DEVICE FOR A GAMING SYSTEM" discloses a method of
30 verifying a cashout value encoded in a barcode. In the method,
The cashout value is read immediately after the voucher is
printed and the voucher is withheld if a printing error is
detected. However, only verifying a cashout value does not fully
address the verification needs of a casino. In a casino, when
35 a player wishes to cashout with a cashier, the cashier hand

1 47584/FLC/F392

enters a validation character string printed on the voucher into
a terminal for verification. When a gaming machine management
5 system verifies the entered validation character string, the
voucher is paid.

Therefore, a need exists for verification of the printing
of a validation character string on a voucher.

10 SUMMARY OF THE INVENTION

In one aspect of the invention, a method is provided for
verification of a voucher after printing by a gaming printer.
A human readable validation character string is received by a
printer controller for printing on a voucher. A scanned
15 validation character string is read from the voucher using an
optical recognition process as the voucher is being printed. The
voucher is verified by comparing the received and scanned
validation character strings. If the two validation character
strings are different, the voucher may be voided by the printer
20 controller before the voucher is finished being printed.

In another aspect of the invention, a method is provided for
verification of a voucher by a gaming printer. A printer
controller receives a validation character string and prints the
received validation character string on a voucher. The printer
25 controller scans the voucher for a scanned validation character
string and verifies the voucher using the received validation
character string and the scanned validation character string.

In another aspect of the invention, the received validation
character string is generated by a gaming machine interface
30 board.

In another aspect of the invention, the received validation
character string is received from a gaming machine management
system.

5 In another aspect of the invention, the scanned validation character string is generated using an optical character recognition process.

In another aspect of the invention, the optical character recognition process is performed by a printer controller.

In another aspect of the invention, the optical character recognition process is performed by a voucher scanning device.

10 In another aspect of the invention, the voucher is verified by comparing the received validation character string and the scanned validation character string.

In another aspect of the invention, the voucher is voided if voucher is not verified.

15 In another aspect of the invention, the voucher is scanned while the voucher is being printed.

20 In another aspect of the invention, an apparatus is provided for verification of a voucher by a gaming printer. The apparatus includes means for receiving a validation character string and printing the received validation character string on a voucher. The apparatus further includes means for scanning the voucher for a scanned validation character string and means for verifying the voucher using the received validation character string and the scanned validation character string.

25

BRIEF DESCRIPTION OF THE DRAWINGS

These and other features, aspects, and advantages of the present invention will become better understood with regard to the following description, appended claims, and accompanying drawings where:

FIG. 1 is an illustration of an exemplary validation character string verification system in accordance with the present invention;

35 FIG. 2 is an illustration of an exemplary voucher in accordance with the present invention;

FIG. 3 is an illustration of an exemplary gaming printer in accordance with the present invention;

5 FIG. 4 is an illustration of an exemplary gaming printer incorporated into an exemplary gaming machine management system in accordance with the present invention; and

10 FIG. 5 is a process flow diagram of a validation character string verification process in accordance with the present invention.

DETAILED DESCRIPTION OF THE INVENTION

FIG. 1 is an illustration of an exemplary validation character string verification system in accordance with the 15 present invention. A validation character string verification system 10 includes a printer controller 12 operatively coupled to a print head 14 and a voucher scanning device 24. The printer controller uses the print head to print a voucher 18 including a validation character string 22. As the voucher is being 20 printed, the printer controller uses the voucher scanning device to scan the previously printed validation character string. If the printer controller determines that the scanned validation character string has an error, then the printer controller voids or retrieves the voucher.

25 In slightly more detail, the printer controller transmits print head control signals 16 to the print head. The print head control signals include voucher printing instructions for generation of the voucher by the print head. The print head uses the voucher printer instructions to print the voucher including 30 a barcode 20 and the validation character string.

In one embodiment of a voucher in accordance with the present invention, the barcode is an encoded validation character string. In another embodiment of a voucher in accordance with the present invention, the barcode is an encoded cashout value

1 47584/FLC/F392

for the voucher and the validation character string is a separate character string or number used to validate the voucher.

5 The voucher scanning device scans the voucher as the voucher is being printed by the print head. In one embodiment of a voucher scanning device in accordance with the present invention, the voucher scanning device is a Charged-Coupled Device (CCD) optical scanner. The voucher scanning device transmits voucher
10 scan signals 26 to the printer controller. In one embodiment of a voucher scanning device, the voucher scan signals are unprocessed and the printer controller uses an optical character recognition (OCR) process to generate a scanned validation character string from the voucher scan signals. In another
15 embodiment, the voucher scanning device includes an OCR process and the voucher scan signals include the recognized characters of the scanned validation character string.

In one embodiment of a validation character string verification system in accordance with the present invention, a
20 GMIB 28 is operably coupled to the printer controller. The printer controller receives printer control instructions 30 from the GMIB. The printer control instructions include the validation character string to be printed by the printer controller on the voucher. The printer controller generates
25 voucher verification signals 32 indicating whether or not the voucher has been verified. The printer controller transmits the voucher verification signals to the GMIB. The GMIB uses the voucher verification signals to determine if the voucher was correctly printed.

30 FIG. 2 is an illustration of an exemplary voucher in accordance with the present invention. Validation character strings may appear in a plurality of locations on a voucher and in a plurality of orientations. In one embodiment of a voucher, a validation character string 22 is printed near and
35 substantially parallel to a leading edge 200 of the voucher. In

another embodiment of a voucher, a validation character string 202 is located near and substantially parallel to a barcode 20.
5 In another embodiment of a voucher, the voucher includes a single validation character string in a plurality of locations and a plurality of orientations.

The validation character string may be any sequence of human readable characters. In one embodiment of a validation character 10 string, the validation character string includes numeric characters with interspersed spaces and dashes. In another embodiment of a validation character string, the validation character string includes alphanumeric characters.

FIG. 3 is an illustration of an exemplary gaming printer 15 including an exemplary validation character string verification system in accordance with the present invention. A gaming printer 300 includes a printing mechanism 301. The printing mechanism includes a print head 14 for printing vouchers and a voucher scanning device 24 for scanning a validation character 20 string. In one embodiment of a validation character string verification system, the print head and voucher scanning device are physically located such that the voucher scanning device can scan the voucher for the validation character string and a printer controller can finish a verification process of the 25 validation character string before the print head has finished printing the voucher. In another embodiment of a validation character string verification system, the printer can invalidate the voucher before the voucher leaves the printer mechanism. In another embodiment of a validation character string verification 30 system, the printer can retrieve a voucher so that a player cannot obtain the voucher if the voucher fails the verification process.

FIG. 4 is an illustration of an exemplary gaming printer incorporated into an exemplary gaming machine management system 35 in accordance with the present invention. A gaming machine

management system 400, such as a slot machine management system, is operably coupled to a plurality of gaming machines 402, 404, 5 by a communications network 405 adapted for communications using a variety of protocols. The gaming machine management system is further operably coupled to a cashier's terminal 408. In operation, a player 412 plays the gaming machine and requests a cashout voucher (not shown). The gaming machine uses a gaming 10 printer 300 to print a cashout voucher including a validation character string. The player takes the voucher to a cashier 414. The cashier uses the cashier terminal to enter the validation character sting included in the voucher into the gaming machine management system. The gaming machine management system 15 validates the voucher for the cashier. If the gaming machine management system validates the voucher using the validation character string, the cashier pays the player the cashout value of the voucher.

In one embodiment of a gaming machine management system, the 20 gaming machine management system is operably coupled to a gaming machine via a GMIB 28. The GMIB receives gaming machine management system signals transmitted by the gaming machine management system for management of the functions of a gaming machine. Additionally, the GMIB transmits gaming machine status 25 signals to the gaming machine management system. For example, the GMIB receives voucher verification signals generated by the previously described voucher verification process as implemented within the gaming printer. If a voucher fails the verification process, the validation character string is transmitted to the 30 gaming machine management system for further processing such as alerting casino personnel.

In one embodiment of a gaming machine management system, the validation character string represents an account identifier generated by the gaming machine management system for cashout 35 transactions. The validation character string is associated with

an account wherein a monetary amount equal to the value of a
5 voucher's cashout value is stored. In this embodiment, the
validation character string is used by the cashier to access the
account for a transaction such as cashing the voucher for a
player. Additionally, the player may use the voucher in another
gaming machine's bill acceptor 410. When the voucher is cashed
10 by the player, or the voucher is used in another gaming machine's
bill acceptor 416, the voucher account is emptied and deleted by
the gaming machine management system.

' FIG. 5 is a process flow diagram of a validation character
string verification process in accordance with the present
invention. A printer controller receives 500 a validation
15 character string. The printer controller prints 502 a voucher
including the received validation character string. The printer
controller does so by using the received validation character
string to generate print head control signals. The printer
controller transmits the print head control signals to a print
20 head. The print head receives the print head control signals and
uses them to print a voucher including the validation character
string. The printer controller scans 504 the voucher for a
scanned validation character string as the print head is printing
the voucher. The printer controller scans the voucher using a
25 voucher scanning device. The voucher scanning device generates
voucher scan signals including the scanned validation character
string by scanning the voucher as the voucher is being printed.
The printer controller receives the voucher scan signals
including the scanned validation character string.

30 In one embodiment of a validation character string
verification process, the printer controller generates a scanned
validation character string using the voucher scan signals in an
OCR process. In another embodiment of a validation character
string verification process, the voucher scan signals include a
35

1 47584/FLC/F392

scanned validation character string generated in an OCR process by the voucher scanning device.

5 The printer controller compares the scanned validation character string and the received validation character string to verify 506 the scanned validation character string. If the verification process fails, the printer controller voids 508 the voucher.

10 In an embodiment of a validation character string verification process, the printer controller receives the validation character string to be printed from a GMIB. In another embodiment of a validation character string verification process, the printer controller receives the validation character string to be printed from a gaming machine management system.

15 Although this invention has been described in certain specific embodiments, many additional modifications and variations would be apparent to those skilled in the art. It is therefore to be understood that this invention may be practiced otherwise than as specifically described. Thus, the present embodiments of the invention should be considered in all respects as illustrative and not restrictive, the scope of the invention to be determined by any claims supported by this application and the claims' equivalents rather than the foregoing description.
